

COMPACT STORAGE UNIT AND WORKSTATION FOR ROLLED AND/OR COILED MATERIALS

Abstract

A storage unit/workstation is described which allows efficient storage and use of several rolls of package wrapping material in conjunction with the tools needed to perform such wrapping. The storage unit/workstation includes a cabinet wherein the rolls of wrapping material are mounted to allow the wrapping material to be dispensed by unspooling it from the rolls. A working platform is situated below the cabinet so that the user may place a package on the platform and wrap it with wrapping material pulled from the cabinet. The platform may be stowed when not in use.
